Artificial Intelligence and Deep Learning

Sargur N. Srihari
srihari@buffalo.edu
Topics

• Artificial Intelligence History
• AI paradigm shifts
  – Deep Learning
• Disruption caused by AI
  – Software development
  – Societal
• India and AI
History of AI

• Greek Mythology

Pygmalion of Cyprus
Sculpts marble Galatea that came to life (falls in love)
GBS’ Pygmalion: Higgins teaches Eliza to speak Queen’s English

Eliza is first AI program
(Weizenbaum, MIT)

• Indian Mythology

Ganesa (Buddhipriya)
Parvati forms sandalwood Ganesa, whose head is transplanted from an elephant
Today AI is ubiquitous

- Automate routine labor
  - Search
    - Google
    - Baidu

- Understand speech
  - SIRI, Alexa

- Autonomous Vehicles
Handwriting as “Fruit Fly” of AI

NYU, Toronto, Montreal, Baidu
Technology Ages (50-year spans)

- **1771** Industrial Revolution
  - Arkwright’s mill in Cramford

- **1826** Age of Steam and Railways
  - “Rocket steam” engine for Manchester railway

- **1875** Age of Steel, Electricity & Heavy Eng.
  - Carnegie Bessemer steel plant in Pittsburgh

- **1908** Age of Oil, Automobile, Mass Production
  - First model T comes out in Detroit

- **1971** Age of Information & Telecommunications
  - Intel microprocessor announced in Santa Clara

- **2017** Age of Artificial Intelligence
  - Machines and people connected
    - Data is new oil, gold
Disruptions due to AI

Disruptions due to AI

42% of US jobs at risk over two decades.

International (Rich and mid-income):
14% of jobs in 32 countries have 70% risk
For 32% of jobs, that probability is 60%
Thus 210m jobs at risk in those countries alone.
Rich-countries less at risk than mid-income states

AI will outperform humans in*:
- Translating languages 2024
- Driving a truck 2027
- Working in retail 2031
- Working as a surgeon 2053

Outperform humans in all: 50% chance in 45 years
Automating all human jobs 120 years

*NIPS/ICML Survey
“Artificial Intelligence is poised to disrupt the world”
NITI Aayog
AI development (much to be done)

• Paradox
  – Hard problems for people are easy
  – Easy problems for people are hard

• Early AI (Artificial Narrow Intelligence)
  – Chess, GO

• Today’s AI (Artificial General Intelligence)
  – Solve easy tasks for people:
    • Recognize faces in images
What tasks require intelligence?

• Reasoning
  – Solve puzzles, make judgments under uncertainty
• Planning
  – Strategies or action sequences, e.g., for robots
• Learning
  – Improve performance on a task with data
• Communicating in natural language
• Integrating all these skills towards goals
• Abilities to sense, act
Everyday life needs knowledge

- Knowledge is intuitive and subjective
  - Key challenge of AI is how to get this informal knowledge into a computer

- Knowledge-based Approach
  - Hard-code knowledge in a formal language
  - Computer can reason about statements in these languages using inference rules
Knowledge-Based AI

Rule-based System

Output

Hand-designed program

Input

Disadvantage: Unwieldy process
Time of human experts
People struggle to formalize rules with enough complexity to describe the world
The Machine Learning approach

- Difficulties of hard-coded approach suggests:
  - Allow computers to learn from experience
- Determine what feature representations to use
- Map the features to outputs

Decide whether email is spam
Two paradigms in AI

Rule-based System

- Input
- Hand-designed program
- Output

Classic Machine Learning

- Input
- Hand-designed Features
  - Mapping from features
  - Output

Shaded boxes indicate components that can learn from data
Designing right set of features

• Simple Machine Learning depends heavily on representation of given data

• For detecting a car in photographs
  – Tire shape difficult in terms of pixel values
    – Shadows, glare, occlusion
Representation Learning

• Solution: use ML to not only learn mapping from representation to output but representation itself
  – Better results than hand-coded representations
• Allows AI systems to rapidly adapt to new tasks
  – Designing features can take great human effort
    • Can take decades for a community of researchers
• Does not need programmer to have deep knowledge of the problem domain
Deep Learning

- Understand the world as hierarchy of concepts
  - How these concepts are built on top of each other is deep, with many layers
  - Weights learnt by gradient descent

\[ x^{t+1} = x^t - \epsilon \nabla_{x^t} f(x^t) \]
Unsupervised Representation Learning

• Autoencoder
  – Encoder:
    • Converts input into a representation
  – Decoder:
    • Converts representation back to input
Language Processed as Numbers

- **Training Data**
- **Word-to-vec**
  - One-hot vector mapped to vector of 300
- **Word embedding**
  - Similar words are close together
Three Paradigms of AI

Rule-based System

- Input
- Hand-designed program
- Output

Classic Machine learning

- Input
- Hand-designed Features
- Mapping from features
- Output

Representation Learning

- Input
- Features
- Mapping from features
- Additional layers of more abstract features
- Simple features
- Output

Deep Learning

- Input
- Simple features
- Output

Shaded boxes indicate components that can learn from data.
Disruption in Software Development

• Deep Learning is not just another tool
  – It is a fundamental shift in how software is written

• Software 1.0 (Classical “stack”)
  – It is code we write
  – e.g., LAMP (Linux, Apache, MySQL, Python/Perl)

• Software 2.0 (Code written by Optimizer)
  – It is in a user unfriendly language
    • There are millions of weights
  – No human involved in coding
Software 1.0 and 2.0: Fizzbuzz

• Print \( i = 1 \) to 100, except:
  • if divisible by 3 print `fizz`,
  • if divisible by 5 print `buzz`,
  • if divisible by both 3 and 5 print `fizzbuzz`

• Two approaches:
  – Software 1.0: C++
  – Software 2.0: Python/Tensorflow

```c++
#include <iostream>
using namespace std;

int main()
{
    for(int i=1;i<=100;i++)
    {
        if((i%3 == 0) && (i%5==0))
            cout<<"FizzBuzz\n";
        else if(i%3 == 0)
            cout<<"Fizz\n";
        else if(i%5 == 0)
            cout<<"Buzz\n";
        else
            cout<<i<<"\n";
    }
    return 0;
}
```

```python
def model(X, w_h, w_o):
    h = tf.nn.relu(tf.matmul(X, w_h))
    return tf.matmul(h, w_o)
```
Program Space: Software 1.0 vs 2.0

Software 1.0
By writing each line of code, programmer identifies a point in program space with some desirable behavior

Software 2.0
Restrict search space to continuous subset of program space
Search is made efficient by using stochastic gradient descent

*A. Karpathy, Tesla*
Benefits of Software 2.0

– Computationally homogeneous
  • Sandwich of two operations: matrix multiply, RELU

– Simple to bake into silicon
  • Small instruction set

– Constant run time
  • Every iteration of forward pass has same FLOPS
  • Constant memory use

– Highly portable: sequence of matrix multiplies is easier

– Very agile
  • C++ is hard to speed-up, instead remove half of channels

– Can meld into optimal whole
  • Software often has modules, can jointly optimize

– It is better than you
Limitations of Software 2.0 stack

- After training we have large networks that work very well, but hard to tell how
  - 90% accurate model we understand
  - 99% accurate model we don’t

- Can fail unintuitively (Adversarial examples)

\[
x + 0.07 \times \text{sign}(\nabla_x J(\theta, x, y)) \quad (y = \text{"panda" with 58\% confidence})
\]

\[
x + \epsilon \times \text{sign}(\nabla_x J(\theta, x, y)) \quad (y = \text{"gibbon" with 99\% confidence})
\]
How Deep Learning disrupts CS

• **Software Developer**
  - **Present:** Write and maintain layers of tangled code
  - **Future:** A teacher—curate training data & analyze results

• **Mathematics**
  - **Present:** Logic, Discrete mathematics
  - **Future:** Probability Theory, Calculus, Linear Algebra

• **Programming Environments**
  - **Present:** C++, Java
  - **Future:** Tensorflow/Pytorch/Gluon/…
    - In ten years most software jobs won’t involve programming

• **Hardware**
  - **Present:** CPUs
  - **Future:** GPUs
The transition

• Conventional software can be replaced with a deep learning solution with improvement, e.g. *, e.g.:
  – Upgrading search ranking
  – Data center energy usage
  – Language translation
  – Solving GO

• Repositories
  – Github is home for Software 1.0 code
  – Software 2.0 repositories are datasets
    • Commits are additions and edits of the labels

*Projects at Alphabet:
AI Development: US, China lead

Deep Learning Frameworks (US)  
- Amazon
- AWS
- TensorFlow
- Keras
- Caffe2
- PyTorch
- theano
- Caffe
- Microsoft CNTK

IJCAI 2018 Papers (China)
- China: 325 (46%)
- European Union: 129 (UK 37, France 22)
- US: 122
- Singapore: 26
- Australia: 23
- Japan: 17
- Hong Kong: 12
- India: 10
- Canada: 10
India’s future role in AI

- Strong fundamentals in mathematics
- Demographic strength
- 50% participation by women
- Large data sets/curation
- NITI Aayog #AIforall
Conclusion

• AI is disrupting CS
• AI will disrupt the world
  – Deep learning is better than you
• India’s role:
  – Long-ramp up as knowledge diffuses through developer community
  – India is positioned well for
    • Development of AI and
    • AI applications
